Genetically Modified Forests From Stone Age to Modern Biotechnology

by Rowland D. Burdon and William J. Libby

In *Genetically Modified Forests* the authors trace the history of tree improvement, helping the reader to understand both human effect on tree genetics and the real and imagined concerns of genetic engineering. This work provides a basis from which teachers, students, state and federal policy makers, forestland managers, landowners, and environmental advocates can gain familiarity with the often-contentious subject of biotechnology.
