

National Visitor Use Monitoring Results
USDA Forest Service
National Summary Report

Data collected FY 2005 through FY 2009
Last updated 25 April 2010

EXECUTIVE SUMMARY

The National Visitor Use Monitoring (NVUM) program provides science-based estimates of the volume and characteristics of recreation visitation to the National Forest System, as well as the benefits recreation brings to the American public. Completed in 5-year cycles, the NVUM program helps the Forest Service to manage its recreation resources in such a way that best meets the needs of visitors while maintaining the quality of the natural resource base. It is important to note that the NVUM process is still relatively new. An initial application occurred nationwide from 2000 to 2003. Significant refinements and improvements to the process were instituted in 2004, and implementation of the revised process began in 2005. Trend information regarding recreation visitation is thus not yet available; rather, these data provide a ‘snapshot’ of annual National Forest visitation. Results in this report are compiled from the most recent field data on each National Forest and Grassland, ranging from FY2005 to FY2009.

Results from the field data yield an estimate of over 173 million recreation visits to National Forests. Further, the American public made an additional 300 million visits to scenic byways and other travel routes near National Forest lands, in which they appreciated the beauty of the National Forests from their vehicles.

Those who recreate on National Forest lands do so to improve their physical, psychological and/or spiritual sense of wellbeing. Their chosen activities vary widely, both in character and location. Some relax as they view natural features or wildlife from the roadside, whereas others pursue solitude as they hike in the remote backcountry. Some engage in off highway vehicle use. Others enjoy water-based recreation, hunt, or camp. The two most common primary recreational activities are hiking/walking and downhill skiing. Just over fifty-seven percent of visitors (about 99.6 million visits) engage in a primary activity that is physically active, which contributes significantly to American efforts to stay healthy.

The characteristics of recreation visitors are as diverse as their chosen activities. Over one-third of visitors to National Forest sites and Wilderness areas are females. Children under the age of 16 account for almost one out of every five visits. All income classes are represented in the recreating public. Half of National Forest visitors live within fifty miles of the forest they visited; nearly twenty percent traveled at least 250 miles to recreate. Nearly sixty percent of visits are made by people who visit at most ten times per year. Those who visit more than 50 times annually account for fourteen percent of the visits.

Customer satisfaction with recreation experiences on National Forest is very high: ninety-four percent of visitors are satisfied with their overall experiences, including over seventy-seven percent who report being very satisfied. Visitors also give very high ratings to their perception of safety – over ninety-four percent are satisfied with this aspect of their experience. Further, eighty-three percent of those who visit sites where fees are required are satisfied with the value they receive for fees paid; only seven percent report being at all dissatisfied with fees.

Visits to National Forest lands are an important contribution to the economic vitality of rural communities. Spending by recreation visitors in areas surrounding National Forests amounts to nearly \$13 billion each year. Visitors who live more than 50 miles from the forest account for the bulk of these contributions; they spend \$10 billion annually. As visitor spending ripples through the US economy, it contributes over \$14 billion to GDP, and sustains a little more than 224,000 full and part time jobs.

The NVUM data highlight the contribution of forest-based recreation in connecting the American people to their natural and cultural heritage, an important element of the Forest Service Recreation Strategy. Such connections are critical to the cultivation of a conservation ethic and sense of resource stewardship among Americans. Recreation also directly facilitates the improvement of American health, a priority in

both the Recreation Strategy and among Forest Service leadership. This report emphasizes the importance of recreation in the creation of rural wealth, which USDA Secretary Tom Vilsack has championed as one of his central causes. Finally, the management of public lands for recreation is wholly consistent with USDA and Forest Service goals to restore American forests, maintain clean water supplies, and provide ecosystem services.

INTRODUCTION

The National Visitor Use Monitoring (NVUM) program provides science-based estimates of the volume and characteristics of recreation visitation to the National Forest System. Information about the quantity and quality of recreation visits is required for National Forest plans, Executive Order 12862 (Setting Customer Service Standards), and implementation of the National Recreation Agenda. The agency's Strategic and Annual Performance Plans require the measurement of user satisfaction and use level.

NVUM ensures that all visitor statistics for National Forests and grasslands produced by the Forest Service use a standardized measure. These standards were established by the Forest Service in the 1970's; however their application is now stricter than in the past. For example, visitors must be physically recreating on Forest Service managed lands for a visit to count. They cannot be passing through, viewing from a non-Forest Service managed road, or just using restroom facilities.

Background and Methods

Results in this report are derived by summing the results from the most recent NVUM fieldwork for each National Forest and Grassland. The results are from NVUM field work completed from FY2005 through FY2009. Any single forest gets sampled one time in 5 years, so in a given year about two dozen forests are engaged in NVUM field data collection. Those forests that completed their NVUM work in 2009 were updating visitation estimates from about 5 years earlier. Thus, this report does not yet provide any true 'trend' measures; it is not a final report. Rather, it represents an iteration of the NVUM process, a 'snapshot' of the most current visitation patterns and activities on National Forest land.

The NVUM methodology is explained in detail in: Forest Service National Visitor Use Monitoring Process: Research Method Documentation; English, Kocis, Zarnoch, and Arnold; Southern Research Station; May 2002 (<http://www.fs.fed.us/recreation/programs/nvum>). In essence, visitation is estimated through a combination of traffic counts and surveys of exiting visitors. Both are obtained from a random sample of locations and days distributed over an entire forest for a year.

All of the surveyed recreation visitors are asked about their visit duration, activities, demographics, travel distance, and annual usage. About one-third were also asked a series of questions about satisfaction. Another one-third were asked to provide information about their income, spending while on their trip, and the next best substitute for the visit.

Satisfaction measures: Survey participants were asked to provide an overall rating of their recreation experiences on a 5-point Likert scale. (A **Likert scale** is a numerical measurement of a respondent's level of agreement with a statement.) About one-third of visitors were asked to rate their satisfaction with and the importance of fourteen items related to the recreation facilities and services at the site or area at which they recreated. The Likert scale for importance ranges from not important to very important. The Likert scale for performance (satisfaction) ranges from very dissatisfied to very satisfied. Results are summarized by site type: day use developed (DUDS), overnight use developed (OUDS), undeveloped general forest areas (GFAs), and Wilderness.

The satisfaction responses are analyzed and reported in several ways. First, a graph of overall satisfaction is presented in Figure 5. Next, two aggregate measures (detailed below) were calculated from the set of 14 separate satisfaction items. The satisfaction elements most readily controlled by managers were aggregated into four categories: developed facilities, access, services, and visitor safety. The site types sampled were aggregated into three groups: developed sites (includes both day use and overnight developed sites), undeveloped areas, and Wilderness.

The first aggregate measure is called “Percent Satisfied Index (PSI)”. The PSI is the proportion of all ratings for the 14 items in each category in which the satisfaction was denoted as either ‘Somewhat satisfied’ or ‘Very Satisfied’. *Conceptually, the PSI indicator shows the percent of all recreation customers who are satisfied with agency performance.* The agency’s national target for this measure is 85%. It is usually difficult to consistently have a satisfaction score higher than 85% due to tradeoffs among user groups and other factors. Table 11 displays the aggregate PSI scores.

The second aggregate measure is called “Percent Meet Expectations (PME)”. The PME aggregate measures the proportion of satisfaction ratings that are equal to or greater than the importance rating for a given item. This indicator tracks the congruence between the agency’s performance and customer evaluations of importance. *The purpose of the PME measure is to highlight whether those items with higher importance levels also have higher performance levels. Lower PME scores can be interpreted to show ‘gaps’ between desired and actual performance.* Figure 6 displays the PME scores.

Finally, an Importance-Performance Analysis (IPA) (following Hudson, et al, Feb. 2004) was calculated for the mean values of the importance and satisfaction scores. A target level of importance and performance divides the possible set of score pairs into four quadrants. In the IPA literature, these quadrants are typically called, “Keep up the good work”, “Concentrate here”, “Possible overkill”, and “Low priority”. For those unfamiliar with this literature, the “Concentrate here” and “Possible overkill” quadrants might be interpreted as meaning “Explore how performance can be improved” and “Evaluate for possible savings”, respectively.

In the context of the NVUM survey, the target level for each of the 14 satisfaction items was a numerical average score of 4.0. The quadrant titles help to interpret each score, and can provide general guidance for management. The quadrants definitions are:

1. Importance at or above 4.0, Satisfaction at or above 4.0: **Keep up the good work.** These are functions that are important to visitors and which the agency is performing quite well;
2. Importance at or above 4.0, Satisfaction under 4.0: **Concentrate here.** These are functions that are highly important to the public, but performance is not at a satisfactory level. Increasing effort here is likely to have the greatest payoff in overall customer satisfaction;
3. Importance below 4.0, Satisfaction above 4.0: **Possible overkill.** These are functions that are not of the highest importance to visitors, but performance is quite good. It may be possible to reduce effort here without greatly harming overall customer satisfaction;
4. Importance below 4.0; Satisfaction below 4.0: **Low priority.** These are functions where performance is not at high levels, but neither are the importance ratings. Focusing effort here is unlikely to have as great an impact on overall satisfaction as in other areas.

The numerical scores for visitor satisfaction and importance for each of the satisfaction items by site type are presented in Appendix A (Tables A1 – A4). Special attention should be paid to the numeric scores in the Appendix in reviewing and evaluating the IPA results for each item; particular emphasis should be placed on those ratings that are close to but slightly below the 4.0 value, which separates the four quadrants. For these, the distribution of responses as well as the average rating should be reviewed, as the average value could be affected by a relatively small set of very low ratings.

Visitors rated their perception of how crowded their recreation site or area felt to them. Perceptions take into account the type of site and visitors’ expectations. Ratings ranged from 1 (Hardly anyone there) to 10 (Overcrowded).

Spending and Economics: Spending by visitors has important effects to the health of forest-dependent economies. To estimate total spending associated with recreation visits, one needs: an overall visitation

estimate, the proportion of visits in each of a series of visitor types, and the average spending total for each of the respective visitor types. Multiplying these three variables gives the total amount of spending by each type of visitor. Summing over all visitor types gives total spending associated with recreation on National Forest System lands.

One-third of the NVUM surveys included questions about trip-related spending made within 50 miles of the site visited. Dr. Daniel Stynes (Michigan State University) and Dr. Eric White (Oregon State University) developed a typology of visitor types and average spending amounts for each. The spending that occurs on a recreation trip is greatly influenced by the type of trip taken. Visitors on overnight trips away from home pay for some form of lodging (e.g., hotel rooms or campground fees); those on day trips do not. Visitors on overnight trips also generally purchase more food during their trip in restaurants or grocery stores than visitors on day trips. Visitors who are close to home usually spend less than visitors traveling longer distances, especially on items such as fuel and food. Analysis of spending patterns has shown that segments of the visitor market with consistent spending patterns are:

1. local visitors on day trips,
2. local visitors on overnight trips staying on the National Forest,
3. local visitors on overnight trips staying off the National Forest, and
4. non-local visitors on day trips,
5. non-local visitors on overnight trips staying on the National Forest,
6. non-local visitors on overnight trips staying off the National Forest,
7. non-primary visitors.

In addition, these surveys included questions about household income and what the individual considered to be the most likely substitute for their visit to the forest.

Terms Used in this Report

The basic measurements of visitation for the NVUM process are **National Forest visits** and **site visits**. A **National Forest visit** is “one person participating in one or more recreation activities on a National Forest or grassland for an unspecified period of time. A National Forest visit can be composed of multiple site visits.” A **Site visit** is “one person participating in one or more recreation activities at a particular National Forest or Grassland site or area for an unspecified period of time.”

A **confidence interval** is a range of values that is likely to include an unknown population value, where the range is calculated from a given set of sample data. Confidence intervals are always accompanied by a **confidence level**, which tells the degree of certainty that the value lies in the interval. Used together these two terms define the reliability of the estimate, by defining the range of values that are needed to reach the given confidence level. For example, the 2009 national visitation estimate is 173.5 million visits, with a 90% confidence interval of 3.1%. In other words, given the NVUM data, our best estimate is 173.5 million visits, and there is a 90% chance that the true number is between 168.1 million and 178.9 million.

Local visitors travel less than 50 road miles from home to the recreation site; **non-local visitors** travel greater than 50 road miles. **Non-primary visitors** have a primary trip purpose that is something other than recreating on the National Forest – it could be to some other recreation destination, or for some reason other than recreation.

Average values for visit characteristics are calculated by expanding the sample of recreation contacts to the population of National Forest visits. On some tables **median** values (the value of the 50th percentile) are also provided, because the averages can be greatly influenced by a few large values.

Using this Report

While NVUM does provide a national standard for measuring recreation visitor use, it currently cannot be used to identify trends or make assumptions about changing use patterns for the following reasons:

- Trend analysis is typically based on four or more ‘data points’ from the same location. No forest or grassland has yet gone through the NVUM process more than twice, so trends cannot be identified.
- The first application of the NVUM program entailed a novel approach to measuring visitation on National Forest lands. Going through the NVUM process one time on each forest enabled forest staff to adjust their knowledge and identify needed improvements and refinements in field protocols. The sample framework used since 2005 was both better than and different from that in the 2000 – 2003 period, but the changes make comparisons difficult to interpret.
- Better training processes, quality assurance procedures, and reporting tools have also contributed to NVUM improvements. These improvements have greatly enhanced the validity and accuracy of the NVUM results. It is possible that reporting and training improvements also account for a large proportion of the differences in results between the first and second NVUM applications.
- Results presented here reflect forest-level data collected during the period FY2005 through FY2009. The national results are drawn from the second iteration of NVUM process for all reporting units.

The results do provide a good ‘snapshot’ representation of the characteristics of visitors, their visitation patterns, activities, satisfactions, expectations, and the benefits they bring to communities surrounding National Forests.

This report has been written and formatted for a diverse audience. Readers who are interested in accessing the NVUM data utilized here can double click the figures throughout the report (in MS Word) to view a table of the data.

Forest Service Use of NVUM Data

Results from the NVUM program are used for a number of purposes. First, the results are used to report the best current estimate of visitation to National Forests and Wilderness areas, including the proportion of visits that come from targeted demographic groups, including children and minorities. Second, combined with household surveys of recreation participation, the activity patterns provide a sense of the recreation niche for individual National Forests; that is, to identify their unique contribution to the set of outdoor recreation opportunities available to the public. Third, activity and duration patterns are used to measure the contribution the Forest Service makes to the health of American public through participation in active outdoor pursuits. Fourth, customer satisfaction, importance, and crowding ratings are used to provide guidance for how to maintain and improve the set of recreation opportunities the agency provides. Finally, visitor spending profiles and visitation patterns are used to document the contribution that Forest Service recreation visitation makes to the economic well-being of both forest-dependent communities, and to the nation.

VISITATION ESTIMATES

Table 1 displays the estimated number of annual National Forest visits and National Forest site visits for the entire National Forest System. The site visit estimate includes visits to Wilderness areas. Table 2 shows the number of National Forest and Wilderness visits in each Forest Service region, along with the proportion of National Forest visits that take place in Wilderness. The current annual visitation estimate is 173.5 million National Forest visits. The 90% confidence interval for that estimate ranges from 168.1

million to 178.9 million. Wilderness on the National Forest System accommodates just over 6.7 million annual recreational visits.

Most people (86%) who recreate on a particular National Forest describe that forest as their primary recreation destination (Figure 1). That is, the recreation opportunities provided on NFS lands were the main reason these visitors decided to make a trip away from home. For about eight percent of visits, the visit to the forest was a secondary recreation destination, meaning that the trip was focused on recreating someplace other than the National Forest, but they decided to make a side-trip to the forest. For about six percent it was a side trip during a non-recreation trip away from home.

Table 1. National annual visitation estimate for the National Forest System, for FY2005 - FY2009.

Visit Type	National Forest Visits		90% Confidence Interval range (thousands of visits)
	Visits (thousands)	90% confidence interval width (%)	
Total Estimated Site Visits	198,938	3.0	192,970 – 204,906
Designated Wilderness Visits ^a	6,732	7.3	6,240 - 7,223
Total Estimated National Forest Visits	173,526	3.1	168,146 – 178,905

^a Designated Wilderness visits are included in the Site Visits estimate.

Table 2. Regional annual visitation estimates for the National Forest System, for FY2005 - FY2009.

Region	National Forest Visits (1000s)	90% Confidence interval, as % of visits	Wilderness visits (1000s)	90% Confidence interval, as % of visits	% of NF visits that are in Wilderness
01: Northern	11,121	10.7	388	14.2	3.5
02: Rocky Mountain	29,599	5.8	1,172	25.9	3.9

DESCRIPTION OF THE RECREATION VISIT

Demographics

Demographic characteristics provide an overall picture of the customer base for National Forest recreation. Recreation on National Forests provides opportunities for a wide array of people to connect with nature. Just over one-third of the visits to National Forests and Wilderness areas are made by females (Table 3). Among racial and ethnic groups, Hispanics are the most frequent visitors, accounting for more than four percent of all visits to National Forests (Table 4). Nearly nineteen percent of National Forest visits are children under the age of 16 (Table 5). About a quarter of all visits are made in groups that include children.

A large proportion of National Forest visits come from people who live nearby (Figure 3). Slightly more than thirty percent of National Forest visits and about a quarter of Wilderness visits are made by people who live within 25 miles of the place that they visited. Another 15 to 17 percent are from people living between 25 and 50 miles away. Half of all visits to National Forests come from people who live within about 50 miles of the forest. A somewhat higher percentage of Wilderness users come from larger distances; just over thirty percent of Wilderness visits are from people who have traveled more than 200 miles, compared to slightly less than a quarter of National Forest visits. Foreign visitors are relatively uncommon: they make up only about two percent of all visits (Table 6). Europeans account for about half of all foreign visits, and Canadians about 25 percent of foreign visits.

Table 3. Percent of National Forest and Wilderness visits by gender, for FY2005 - FY2009.

Gender	National Forest Visits (%)	Wilderness Visits (%)
Female	35.0	38.9
Male	65.0	61.1
Total	100.0	100.0

Table 4. Percent of National Forest and Wilderness visits by race and ethnicity, for FY2005 - FY2009.

Race/Ethnicity ^a	National Forest visits (%)	Wilderness visits (%)
American Indian/Alaska Native	2.6	1.4
Asian	1.9	2.2
Black/African American	1.1	0.8
Native Hawaiian or other Pacific Islander	0.5	0.2
White	95.8	96.5
Spanish, Hispanic, or Latino	4.3	3.1

^a “Spanish, Hispanic or Latino” is presented in a separate question because it is an ethnicity, not a race. Respondents first stated whether they were of this ethnicity, then a separate question asked which of the racial categories applied to them. Respondents could choose more than one racial group.

Table 5. Percent of National Forest and Wilderness visits by age class, for FY2005 - FY2009.

Age	National Forest visits (%)	Wilderness visits (%)
Under 16	18.6	6.4
16-19	3.5	3.4
20-29	13.2	17.1
30-39	15.7	17.3
40-49	19.3	19.2
50-59	16.5	22.3
60-69	9.8	11.1
70 and over	3.4	3.2
Total	100.0	100.0

Figure 2. Distribution of National Forest and Wilderness visits by age group.

Figure 3. Distribution of National Forest visits by travel distance categories, for FY2005 - FY2009.

Table 6. Percent of National Forest Visits by origin for foreign visitors, for FY2005 - FY2009.

Origin	Percent of NF visits
Asia	0.1
Canada	0.5
Europe	0.9
Mexico	0.1
South America	0.1
Some other origin	0.2

Visit Descriptions

Characteristics of the recreation visit such as length of visit, types of sites visited, activity participation and visitor satisfaction with forest facilities are of interest to a variety of stakeholders. Short visits to National Forests and Wilderness areas are typical (Table 7). Although the average National Forest visit lasts nearly 22 hours, over half of them last less than 4.5 hours. More than 60 percent of National Forest visits last 6 hours or less. In Wilderness areas, the average visit is just over 14 hours. However, a bit more than half of the Wilderness visits last 4 hours or less, and only about 12 percent of Wilderness visits last more than 36 hours.

The great majority of visitors to National Forests only go to one location on the forest during their visit (Table 8). However, some visitors do go to more than one recreation site or area. Often, these are the people who stay for a relatively longer time, and visit a large number of different locations. Also displayed is the average number of people per vehicle for those on a recreation visit.

Visitors were asked how often they visit a given National Forest for all recreational activities, and how often for their primary activity (Table 9). Most visits are made by people who visit the forest on which they were surveyed only a few times per year. Nearly forty-eight percent of visits are made by persons who visited that forest at most 5 times per year. However, people who visit very frequently are not uncommon. About 13 percent of visits are made by people who visit that forest more than 50 times per year. As could be expected, most of the frequent visitors are people who live close to the forests they visit.

Table 7. Visit duration for National Forest visits, for FY2005 - FY2009.

Visit Type	Average Duration (hours)	Median Duration (hours)
Site Visit	11.7	3.0
Day Use Developed	3.7	2.3
Overnight Use Developed	44.6	39.9
Undeveloped Areas	11.8	3.0
Designated Wilderness	14.4	3.6
National Forest Visit	21.9	4.3

Figure 4. Distribution of National Forest and Wilderness visits by duration categories, for FY2005 - FY2009.

Table 8. Other visit characteristics for National Forest recreation visits, for FY2005 - FY2009.

Characteristic	
Percent of recreational visitors who visit just one National Forest site during their entire National Forest visit	92.0%
Average number of National Forest sites visited during each National Forest visit	1.14
Average group size	2.64

Table 9. Percent of National Forest Visits by annual visit frequency, for FY2005 - FY2009.

Number of Reported Annual Forest Visits	Percent of National Forest Visits	
	All Activities	Primary Activity
1 – 5 times per year	47.74	55.47
6 – 10 times per year	11.98	12.42
11 – 15 times per year	7.63	6.43
16 – 20 times per year	4.84	4.71
21 – 25 times per year	3.33	2.99
26 – 30 times per year	3.67	3.07
31 – 35 times per year	0.76	0.75
36 – 40 times per year	2.18	1.77
41 – 50 times per year	4.42	3.32
51 – 100 times per year	6.65	5.04
101 – 200 times per year	3.70	2.61
201 – 300 times per year	1.97	0.95
Over 300 times per year	1.13	0.46

Activities

Most National Forest visitors participate in several recreation activities during each visit. Nearly all identify a single primary activity for the visit. Visitors were asked how many hours they spent doing their primary activity during their visit. Viewing wildlife and/or nature are a part of the National Forest experience for about half of all visits to National Forests (Table 10). Almost 44 percent of the visits include participation in viewing natural features, and about 37 percent include viewing wildlife. Over 40 percent of visits include participation in hiking/walking, and 36 percent indicate that relaxation is part of their experience. The primary activity most commonly indicated is hiking/walking (18.4 percent), followed by downhill skiing (15.0%), viewing natural features (8.2%), fishing (7.8%), and hunting (7.4%). Activities that have the greatest duration of participation include camping, backpacking, and resort use.

Recreation on National Forests also contributes to the overall health of those who visit. Nearly 100 million visitors (over 57 percent) come primarily to engage in a physically active pursuit. On average, these people spend a little more than 7 hours per visit, participating in their primary activity.

Table 10. Activity participation for National Forest recreation visits, for FY2005 - FY2009.

Activity	% of visitors who participated in this activity ^a	% indicating as their primary activity ^b	Average hours per visit spent in primary activity ^c
Developed Camping	8.5	3.1	43.8
Primitive Camping	3.5	0.7	35.4
Resort Use	1.8	0.3	36.9
Nature Center Activities	6.0	0.3	2.3
Nature Study	7.1	0.1	5.5
Viewing Wildlife	37.0	2.0	5.2
Viewing Natural Features	43.9	8.2	3.6
Visiting Historic Sites	6.7	0.4	2.9
Relaxing	36.4	5.8	18.1
Picnicking	9.8	1.6	3.0
OHV Use	3.9	1.5	6.4
Motorized Trail Activity	4.7	1.8	4.8
Snowmobiling	3.1	2.6	5.1
Driving for Pleasure	24.0	4.5	2.8
Motorized Water Activities	3.7	1.4	7.3
Other Motorized Activity	0.5	0.1	5.0
Fishing*	13.2	7.8	6.6
Hunting*	8.3	7.4	12.5
Gathering Forest Products*	4.6	1.0	3.6
Hiking / Walking*	42.0	18.4	3.5
Backpacking*	2.1	0.8	31.5
Horseback Riding*	1.3	0.7	6.0
Bicycling*	3.9	2.0	2.8
Downhill Skiing*	15.6	15.0	8.3
Cross-country Skiing*	3.8	2.9	2.9
Non-motorized Water*	3.1	1.5	6.0
Other Non-motorized	6.4	2.4	3.7
Some Other Activity	6.1	3.4	4.2
No Activity Reported	0.1	0.1	.

^a Survey respondents could select multiple activities so this column may total more than 100%.

^b Respondents were asked to select one activity as their main one. Some selected more than one, so this column may total more than 100%.

^c Computed only for those who indicated the activity was the main activity on their visit.

* Indicates that this activity is considered to be physically active.

CUSTOMER SATISFACTION

A critical element of outdoor recreation program delivery is the evaluation of customer satisfaction with the recreation setting, facilities, and services provided. Overall satisfaction levels for National Forest visits are quite high. In the overall satisfaction rating, less than 3 percent of visitors indicated that they were at all dissatisfied (Figure 5). Over 77 percent indicated being very satisfied.

The Percent Satisfied Index shows very high satisfaction levels for visitors' perceptions of safety (Table 11). Satisfaction levels pertaining to access were above the national target for developed sites and Wilderness, but slightly below the target for undeveloped areas. Across all types of sites, satisfaction levels with services (signage, information, and employee helpfulness) were above 70 percent; however, all were below the target of 85 percent. Comparing these results to the overall satisfaction results indicates that safety and access are among the most important elements of customer satisfaction.

Most places on National Forests do not have any fees associated with recreation use. However for those that do have fees, the majority of visitors are satisfied with the value they receive for the fees they paid. In Day Use Developed Sites, including ski areas, 81 percent are satisfied; in overnight sites, 88 percent are satisfied.

The Percent Meets Expectations (PME) measure shows that the congruence between performance and expectations is quite high for the feeling of safety – greater than 85% in each of the three types of sites (Figure 6). Access elements are above 80% for each of the site types. The PME levels for developed facility items are slightly below the 80% goal for each of the three types of sites. Such a gap seems to indicate that focusing additional attention on the condition of developed facilities could have a positive impact on customer satisfaction.

National importance-performance results show that there are no elements that fall into the 'Concentrate here' quadrant (Table 12). Most were in the 'Keep up the good work' quadrant. Parking lot conditions appear to be of somewhat lesser importance to visitors to undeveloped areas. Across all site types, visitors' evaluations of the importance of interpretive displays were somewhat lower, although satisfaction levels in developed sites were quite high. The overall ratings of road conditions and adequacy of signage were quite good: for just over half of all visits both the importance and satisfaction for these items were rated as high as possible (Figures 7a and 7b).

Feeling that an area is very crowded can diminish recreation satisfaction. Other than in overnight developed sites, very few visitors to National Forests felt that the places they visited were very crowded (Table 13, and Figure 8). For the overnight sites, about eighteen percent of people felt there were high levels (8 or higher) of crowding. However, in dispersed settings, between 45 and 50 percent of the visitors felt that the areas were not crowded, giving a rating of 1 - 3.

Figure 5. Percent of National Forest visits by overall satisfaction rating, for FY2005 - FY2009.

Table 11. National Forest visitation Percent Satisfaction Index^a scores for aggregate categories, for FY2005 - FY2009.

Items Rated	Satisfied Survey Respondents (%)		
	Developed Sites ^b	General Forest Areas	Designated Wilderness
Developed Facilities (includes restroom cleanliness and facility condition)	85.6	79.4	79.5
Access (includes parking availability, parking lot condition, road condition and trail condition)	87.3	83.4	88.5
Services (includes availability of information, signage and employee helpfulness)	82.1	73.7	76.1
Perception of Safety	95.0	93.0	95.9
Value received for any Fee Paid at the site	82.3	81.8	91.8

^a Composite ratings of the proportion of satisfaction ratings scored by visitors as satisfied or very satisfied. The values are computed as the percentages of all ratings for the elements within the groupings that are at or above the target level, and indicate the percent of all visits where the person was satisfied with agency performance.

^b This category includes both Day Use and Overnight Use Developed Sites.

Figure 6. Percent Meets Expectations results for National Forest visits by type of site, for FY2005 - FY2009.

2	15.6	19.4	25.4	24.5
1 Hardly anyone there	5.8	4.4	7.3	6.0

Figure 8. Distribution of National Forest visits into general crowding categories.

Disabilities

The Forest Service is committed to integrating accessibility considerations into its sustainable recreation planning so all people, including those with disabilities, can recreate. The accessibility of recreation facilities is an important part of this policy. Just over seven percent of National Forest visits are made by people in groups where one or more group members have a disability (Table 14). For more than three-fourths of these parties, the facilities they used were rated as accessible.

Table 14. Accessibility for National Forest visits by persons with disabilities, for FY2005 - FY2009.

Item	Percent
Percent of visitors interviewed with group member having a disability	7.6
Of this group, percent who said facilities at site visited were accessible	75.4

VISITOR SPENDING AND ECONOMICS

Visitor Spending

Visitors to National Forests often spend money in nearby communities during the time they are on their recreation trips. These communities benefit directly from that spending. Over 44 percent of visits to National Forests are from residents of the local area who are on day trips (Table 15). Few local residents stay overnight on or near the forests. About 13 percent of non-local residents make visits while on day trips away from home. For the non-locals on overnight trips, most spend the night in facilities off the forest rather than on the forest. For 1 out of about every 7 visits, the National Forest was not the primary destination for the trip away from home.

Visitors spend money in towns that are near National Forests, for things like gasoline, food, lodging, and souvenirs. The spending segments differ markedly in the amount of money per party. In general, visits from outside the local area spend more than do those who are from the local area, and those parties staying overnight off of National Forest lands spend more than those who spend the night on the National Forest.

The final result is the total amount of money directly spent by visitors. Overall, visitors spend a little less than \$13 billion per year in areas around National Forest System lands. Most of that total (over \$8 billion) comes from visitors from outside the local area who are on overnight trips away from home and who are staying in lodging facilities that are not on NFS lands. Although local area residents on day trips account for 44 percent of all visits, they account for only about 9 percent of visitor spending. An activity closely linked to spending amounts is downhill skiing. Nearly half of downhill skiers are also non-local area residents staying in off-forest lodging. As a result, downhill skiers account for about \$4 billion in direct spending.

Table 15. Spending data associated with National Forest land recreation, by Spending Segment, for FY2005 - FY2009.

	Non-local Segments			Local Segments			Non-Primary
	Day	Overnight on NF	Overnight off NF	Day	Overnight on NF	Overnight off NF	
Percent of National Forest Visits	13	11	14	44	3	1	14
People per party	2.5	2.6	2.6	2.1	2.8	2.3	2.5
Local area direct spending per party per visit	\$73.16	\$236.75	\$605.93	\$37.03	\$171.47	\$195.14	\$37.03*
Total direct spending in local economies (millions of \$2007)	\$629.2	\$1,385.0	\$8,543.7	\$1,140.8	\$394.4	\$188.7	\$336.1

*Non-primary visits are assigned the same spending total as local day visits, because that is the best approximation of the additional spending created by the National Forest visit.

Many visitors make trip-related purchases more than 50 miles away from the forest, including both spending made in connection with visiting other recreation areas, or even spending for non-recreation purposes. For those from the local area, the average total trip spending per party is slightly less than \$80 (Table 16), although half of the groups spend \$20 or less. For recreating parties from outside the local area, the average total spending per party per trip is a bit more than \$900.

Slightly more than 40 percent of visits to National Forests are made by people who are spending at least one night away from home. For most of them, that trip includes at least one night spent within 50 miles of the forest they visited. Those spending the night within 50 miles of the forest stay an average of nearly 5 nights. For those spending one or more nights on or near the forest, about 35 percent stay in hotels or lodges off the forest. About 21 percent camp at developed campgrounds on the National Forest, and about 13 percent camp in undeveloped areas of the forest.

Table 16. Visitor Trip Information, for FY2005 - FY2009.

Item	
Average total trip spending per visiting party	\$517.00
Median total trip spending per visiting party	\$60.00
Average total trip spending per visiting <i>local</i> party	\$77.62
Median total trip spending per visiting <i>local</i> party	\$20.00
Average total trip spending per visiting <i>non-local</i> party	\$935.98
Median total trip spending per visiting <i>non-local</i> party	\$250.00
Percent of visits that occur on trips with an overnight stay away from home	40.3
Percent of visits that occur on trips with an overnight stay within 50 miles of the visited forest	36.9
For overnight visits, average number of nights within 50 miles of the forest	4.9
For those staying overnight within 50 miles of the forest, percent indicating each type of lodging	
NF campgrounds ON the National Forest	21.4
Camping in undeveloped areas of the National Forest	13.5
Cabins, lodges, hotels or huts ON the National Forest	6.2

Private campgrounds NOT on the National Forest	2.8
Rented home, condo, cabin, lodge or hotel NOT on the NF	34.5
Private home of friend or relative	14.1
Home, cabin, or condo owned by visitor	8.2
Other	1.6

Household Income

The income distribution of visitors to National Forests is varied (Figure 9). Over ten percent of visits are made by individuals whose household income is over \$150,000 per year. About the same percentage are made by people in households earning less than \$25,000 per year.

Figure 9. Household income of National Forest recreation visits, for FY2005 - FY2009.

Substitute behavior

Travel cost models of economic value must include some measure of substitute behavior. About half of all visitors (52%) indicate that their substitute behavior choice is activity driven – that is, going elsewhere for same activity (Figure 10). A smaller percentage (16%) indicate they would come back later for the same activity. Visitors who said they would have gone somewhere else for recreation also indicated how far from their home this alternate destination was (Figure 11). The distribution of travel distances to alternative locations is very similar to the distribution of travel distances for National Forest visits, which may indicate that a reasonable set of alternative destinations indeed exists for most visits.

Figure 10. Substitute behavior choices of National Forest visitors, for FY2005 - FY2009.

Figure 11. Reported distance visitors would travel to alternative recreation locations, for FY2005 - FY2009.

Appendix A. Detailed Satisfaction Results
